

Documentation for events/assets/messages.js

The process of handling the message event

The classification of messages

A message is classified as **incoming** if:

- The message comes from a DM channel
- The message was not sent by the client user

A message is classified as **relayable** if:

- The message was not sent by a bot
- The message is neither a command or note message
- The channel has an associated relay

A message is classified as **note** if:

- The message was not sent by a bot
- The message was sent in the DMs guild
- The message starts with the note operator

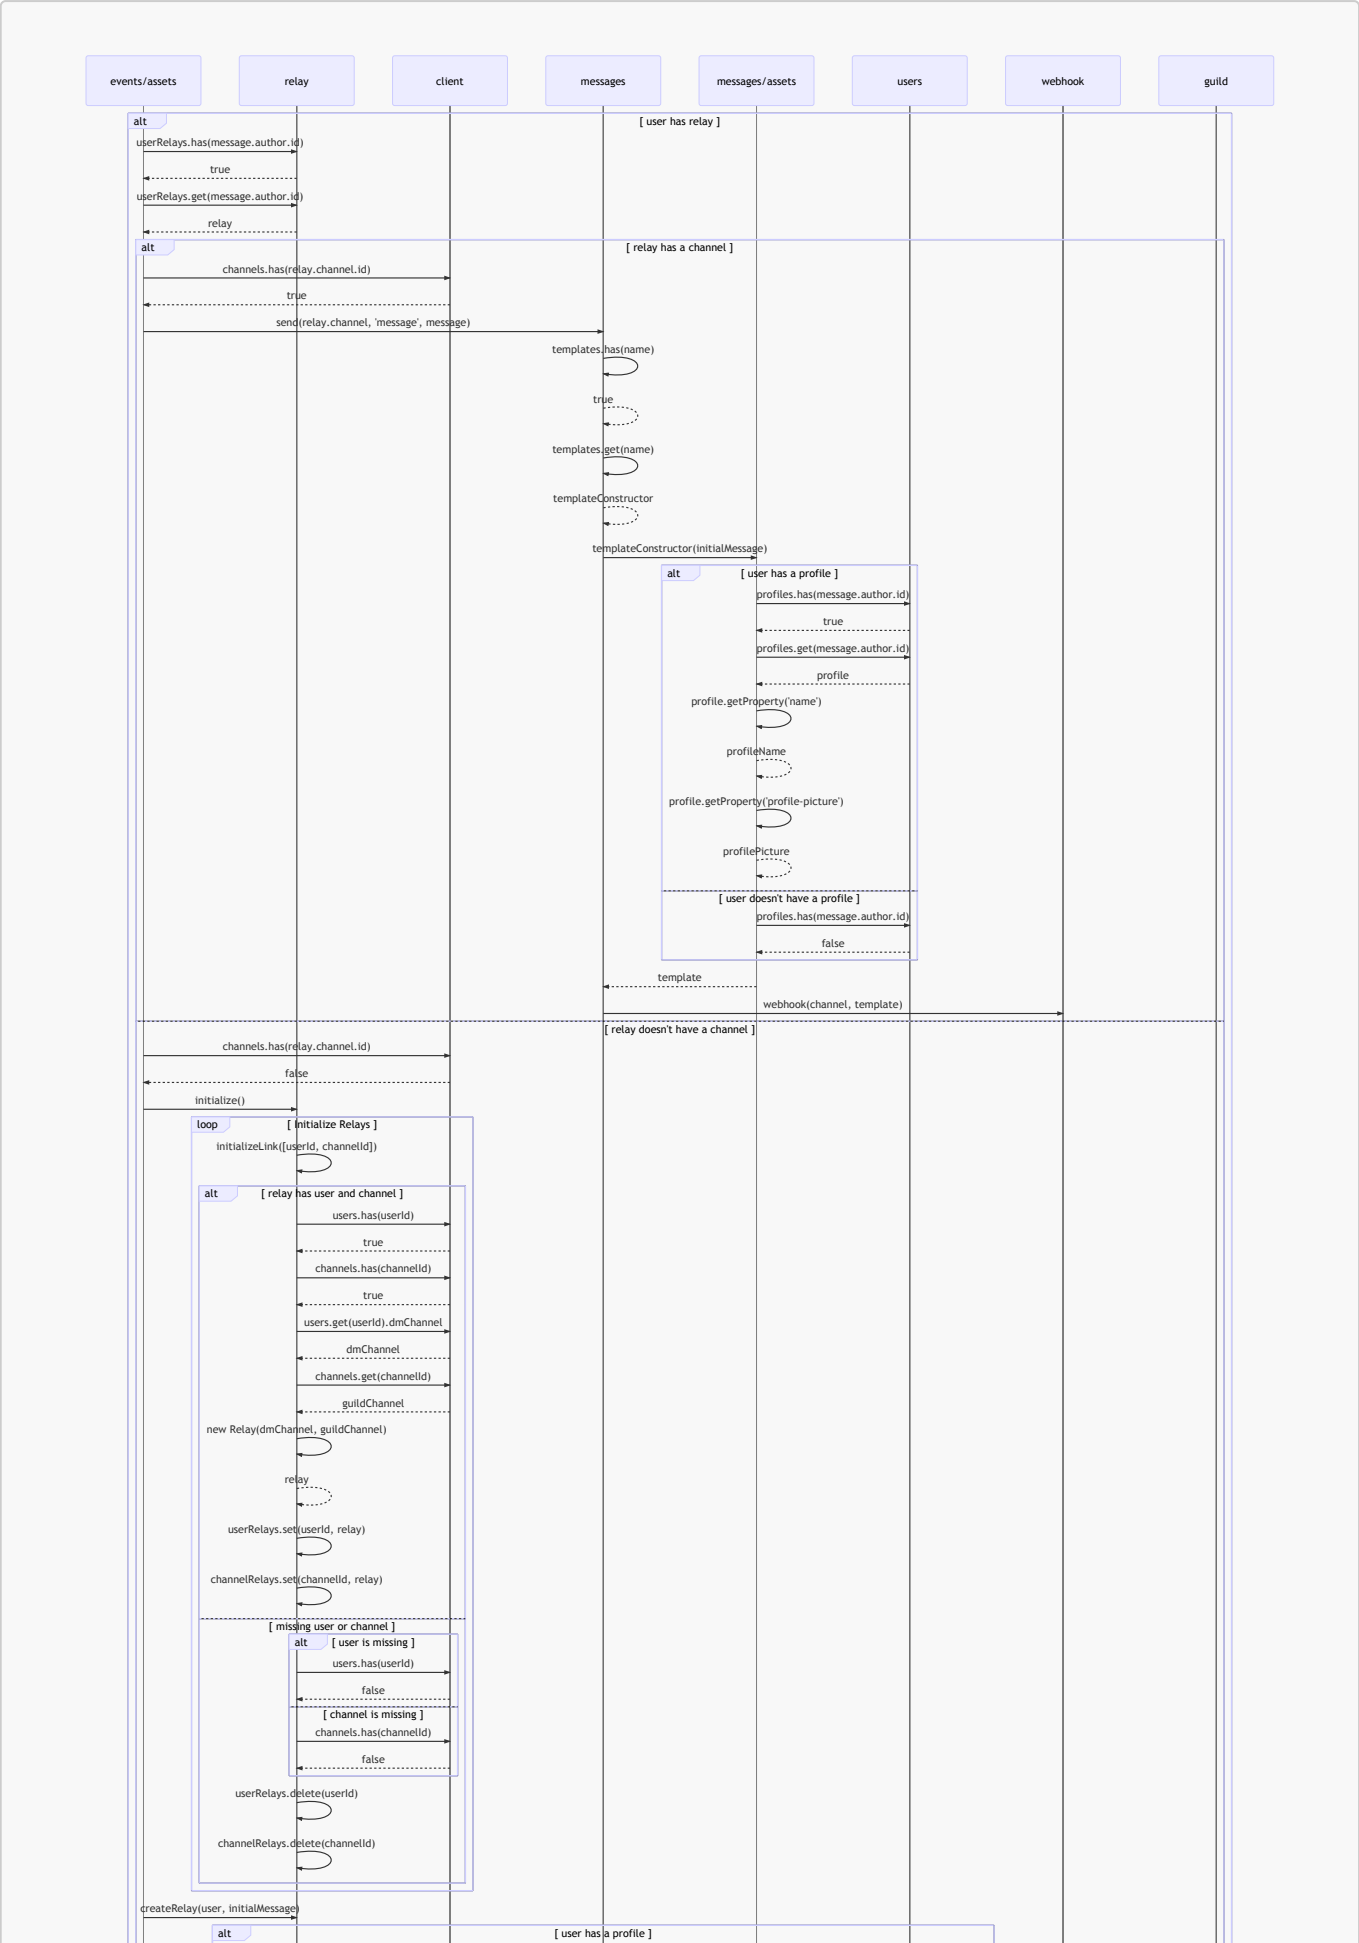

A message is classified as **command** if:

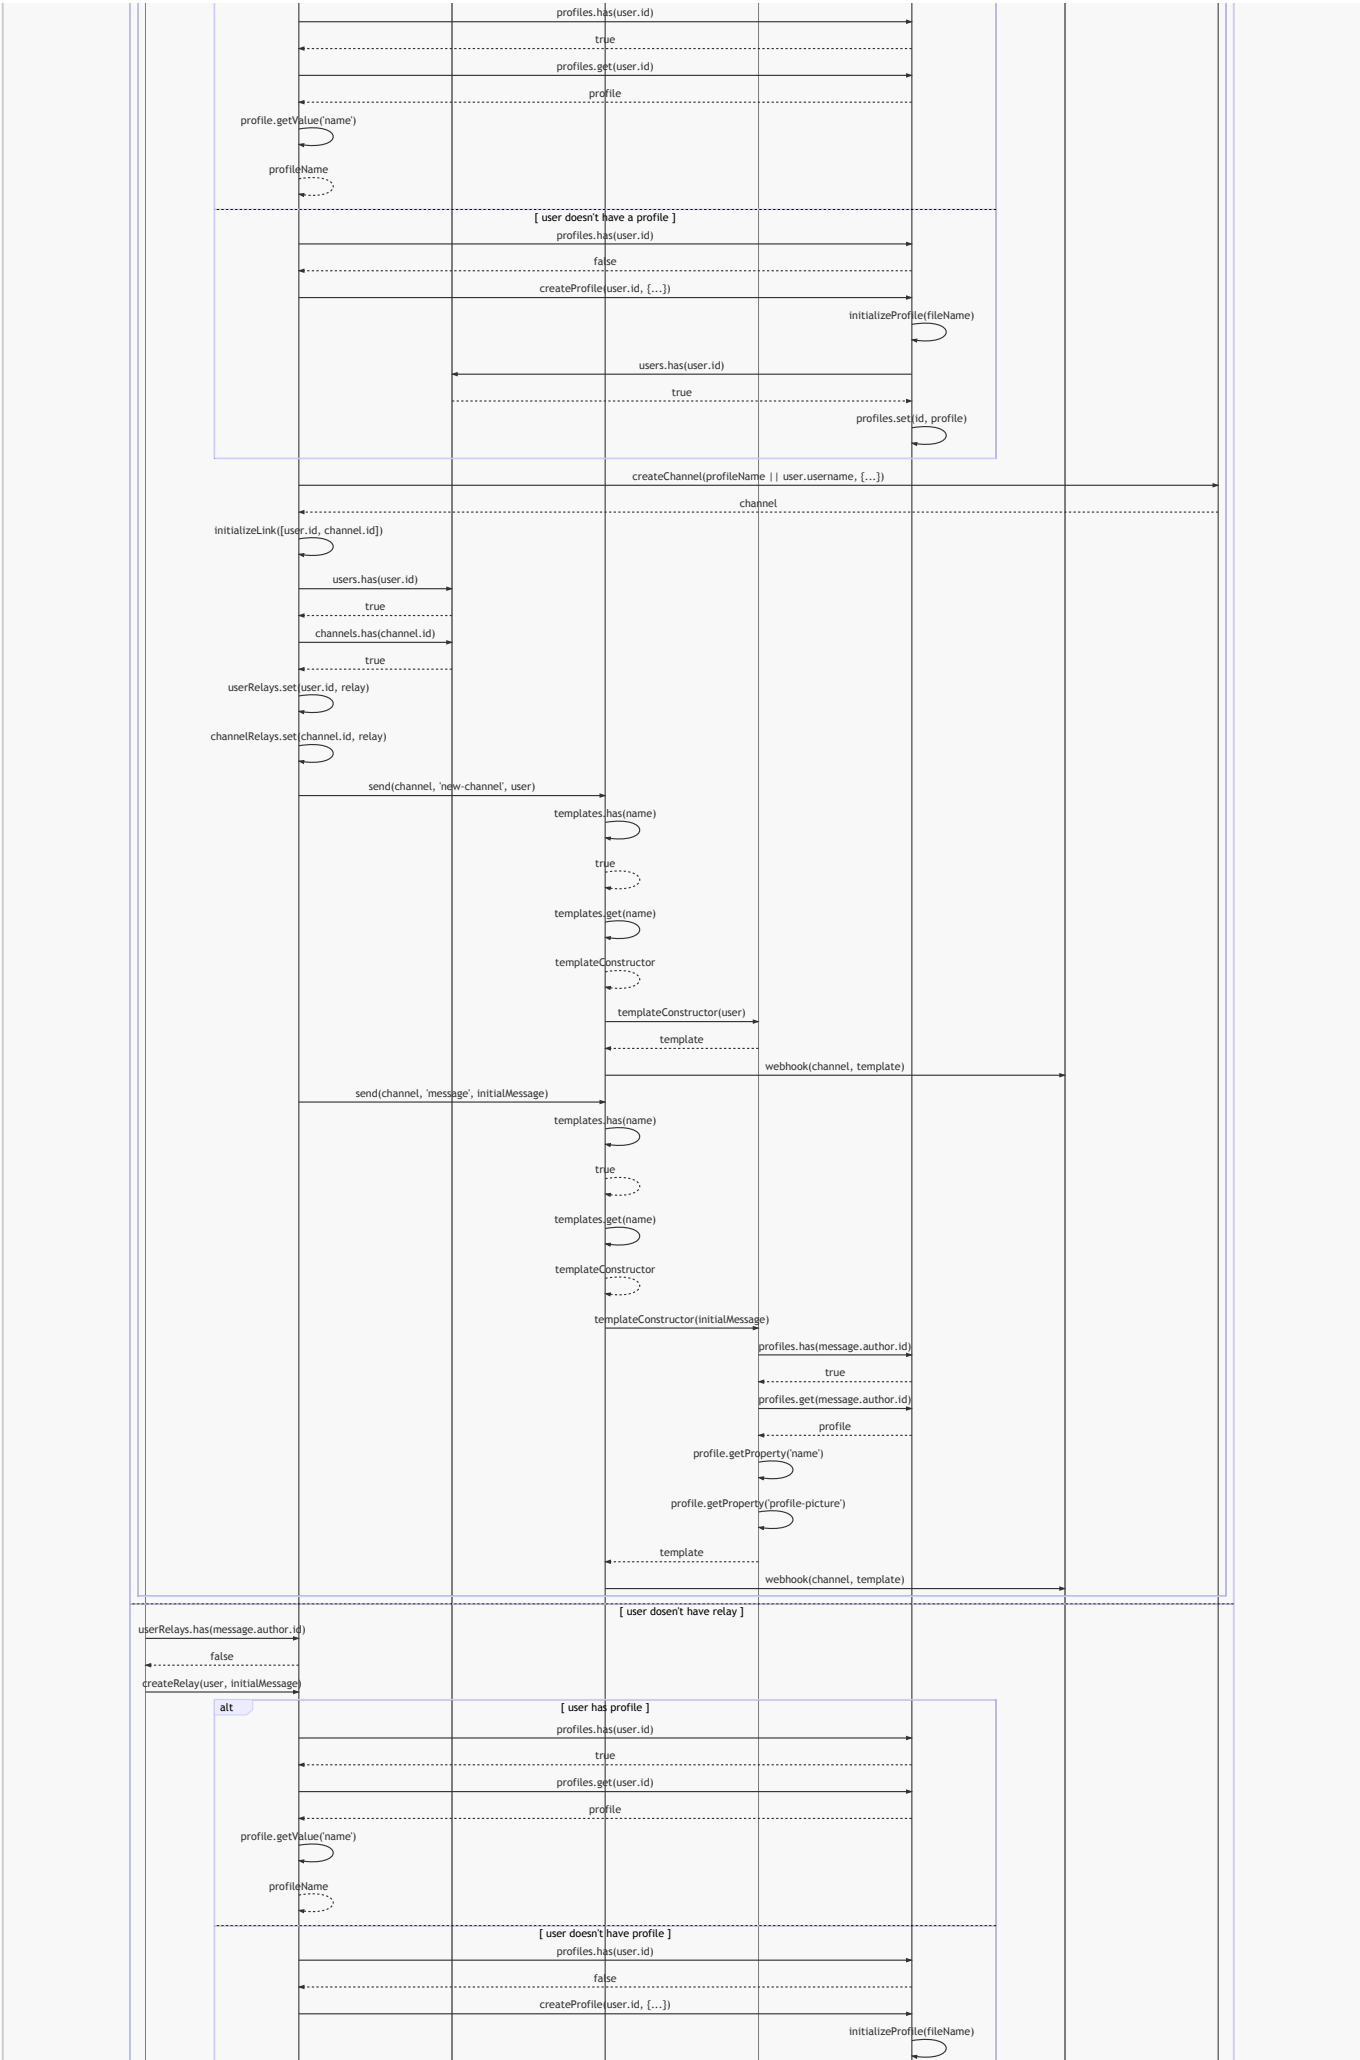

- The message was not sent by a bot
- The message was set in the DMs guild
- The message starts with the command operator

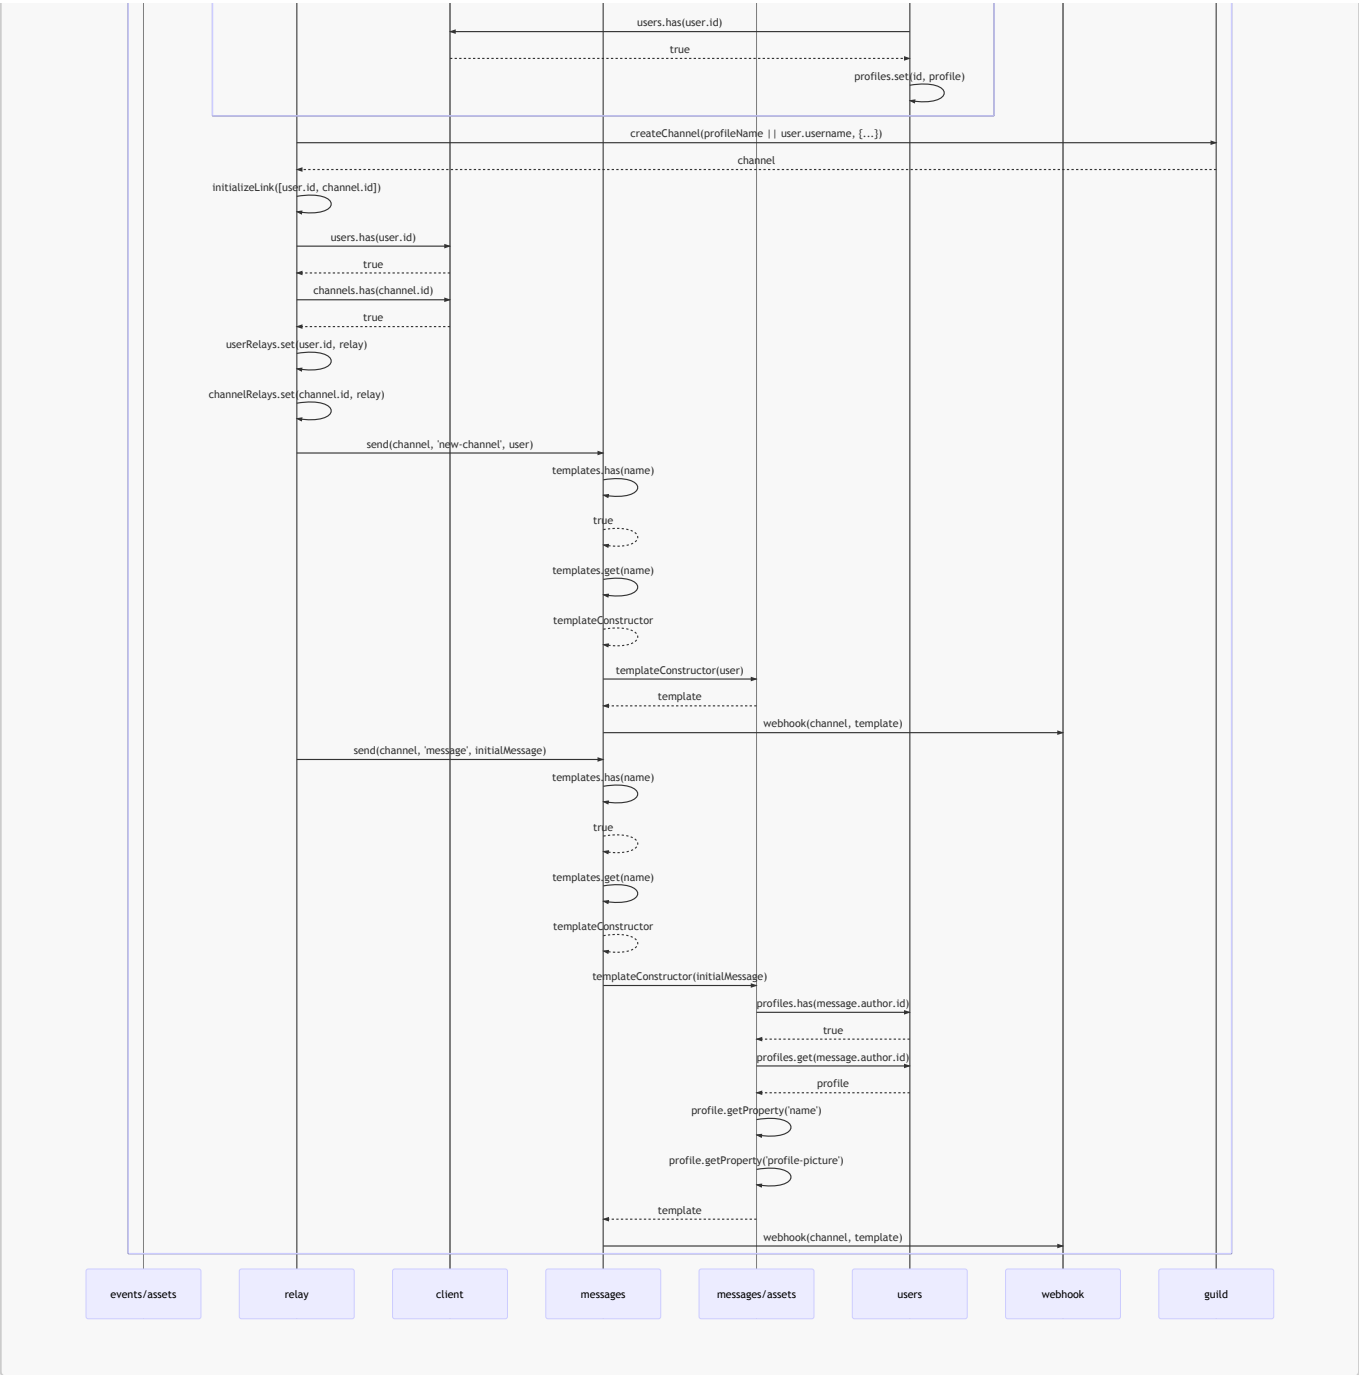

Post-classification

If the message was classified, the handling is now determined by its class
Otherwise, the message is unclassified and will not be handled

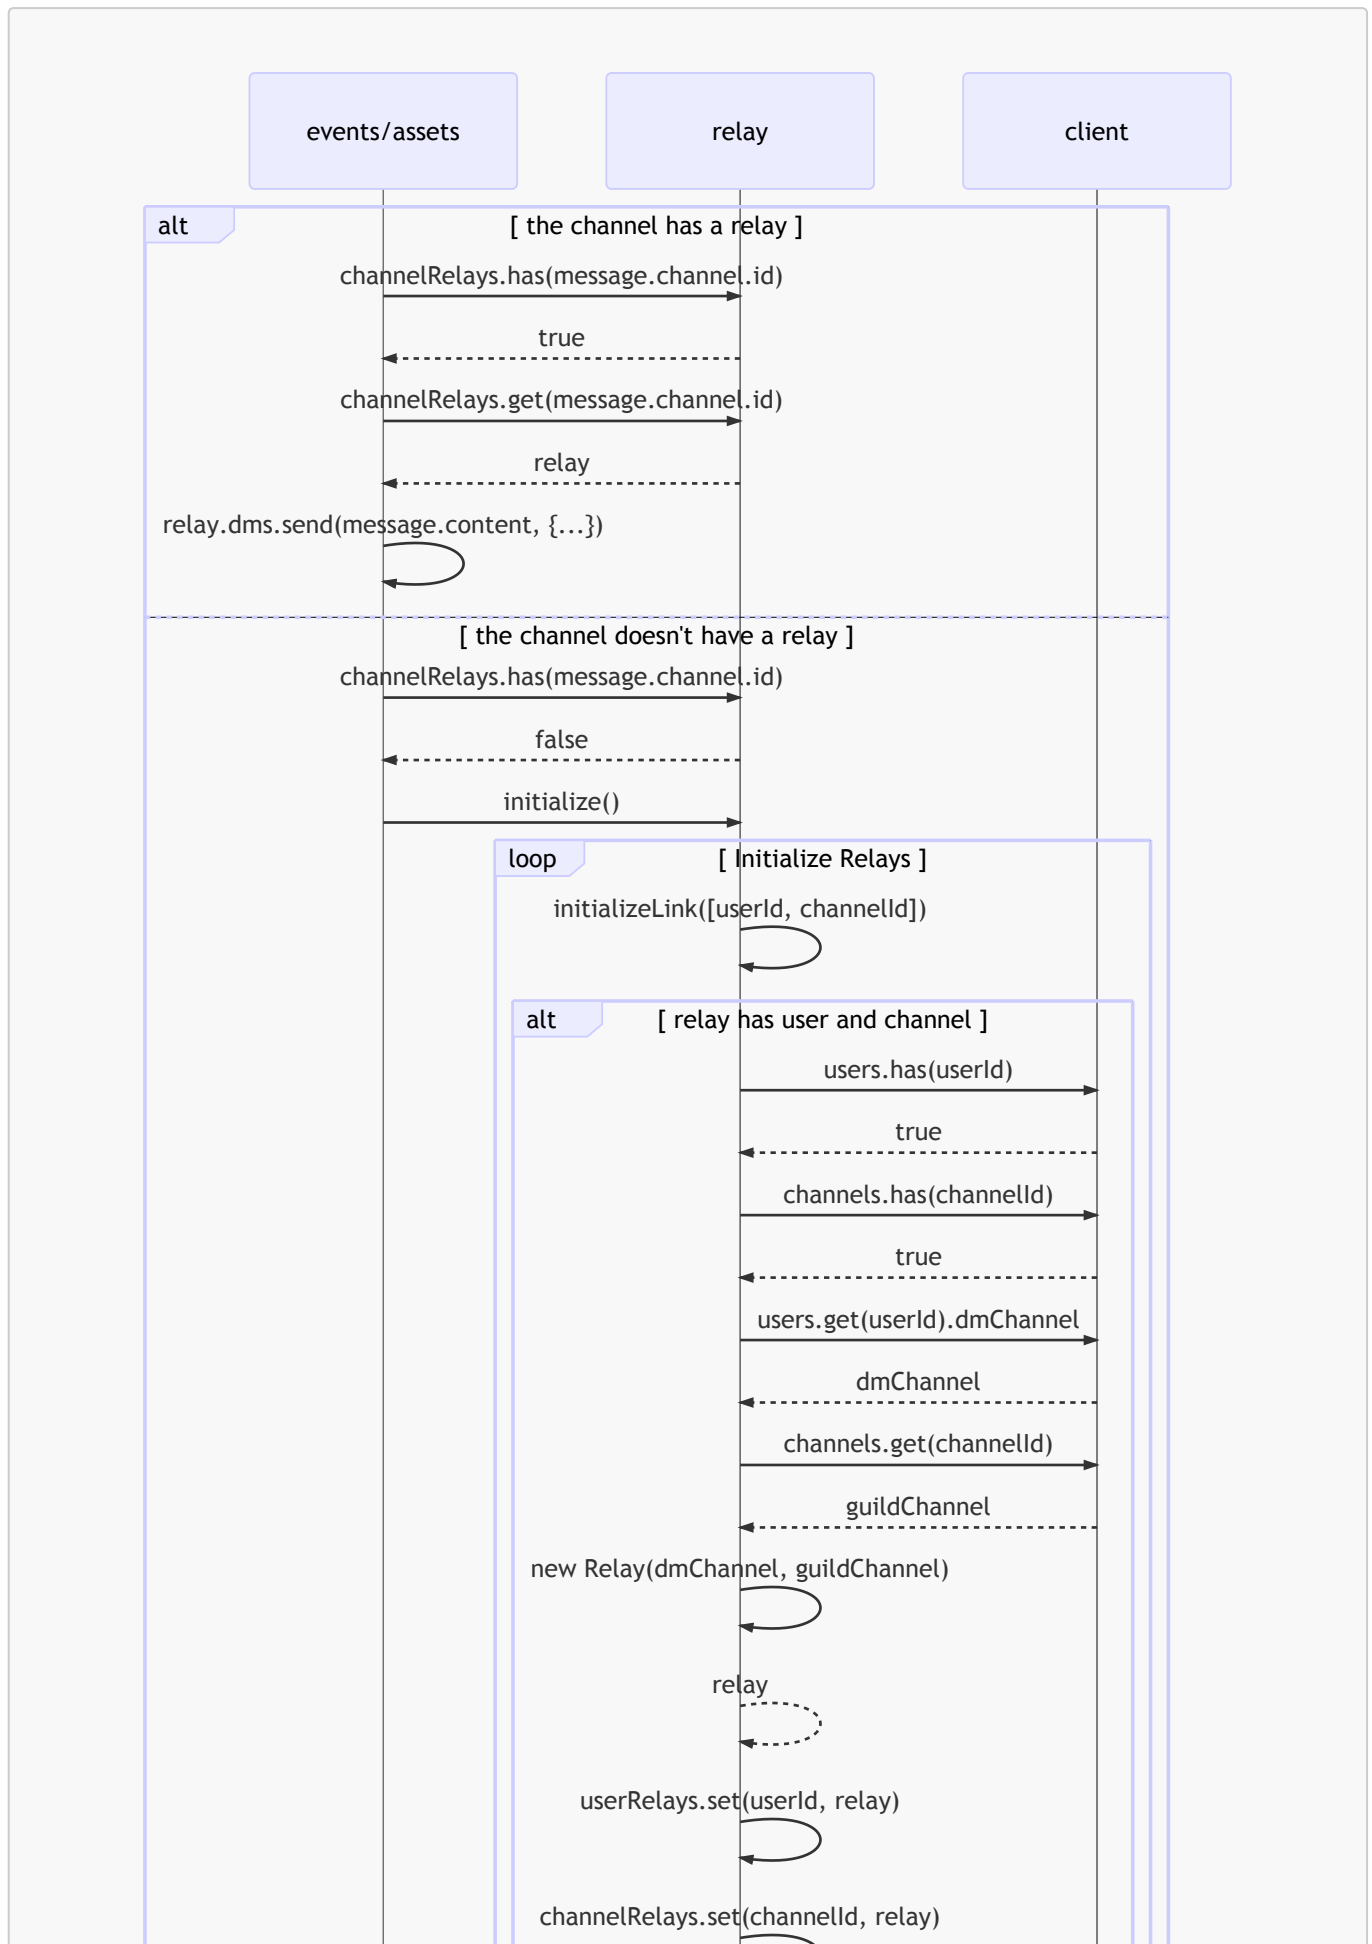

The process of handling an incoming message

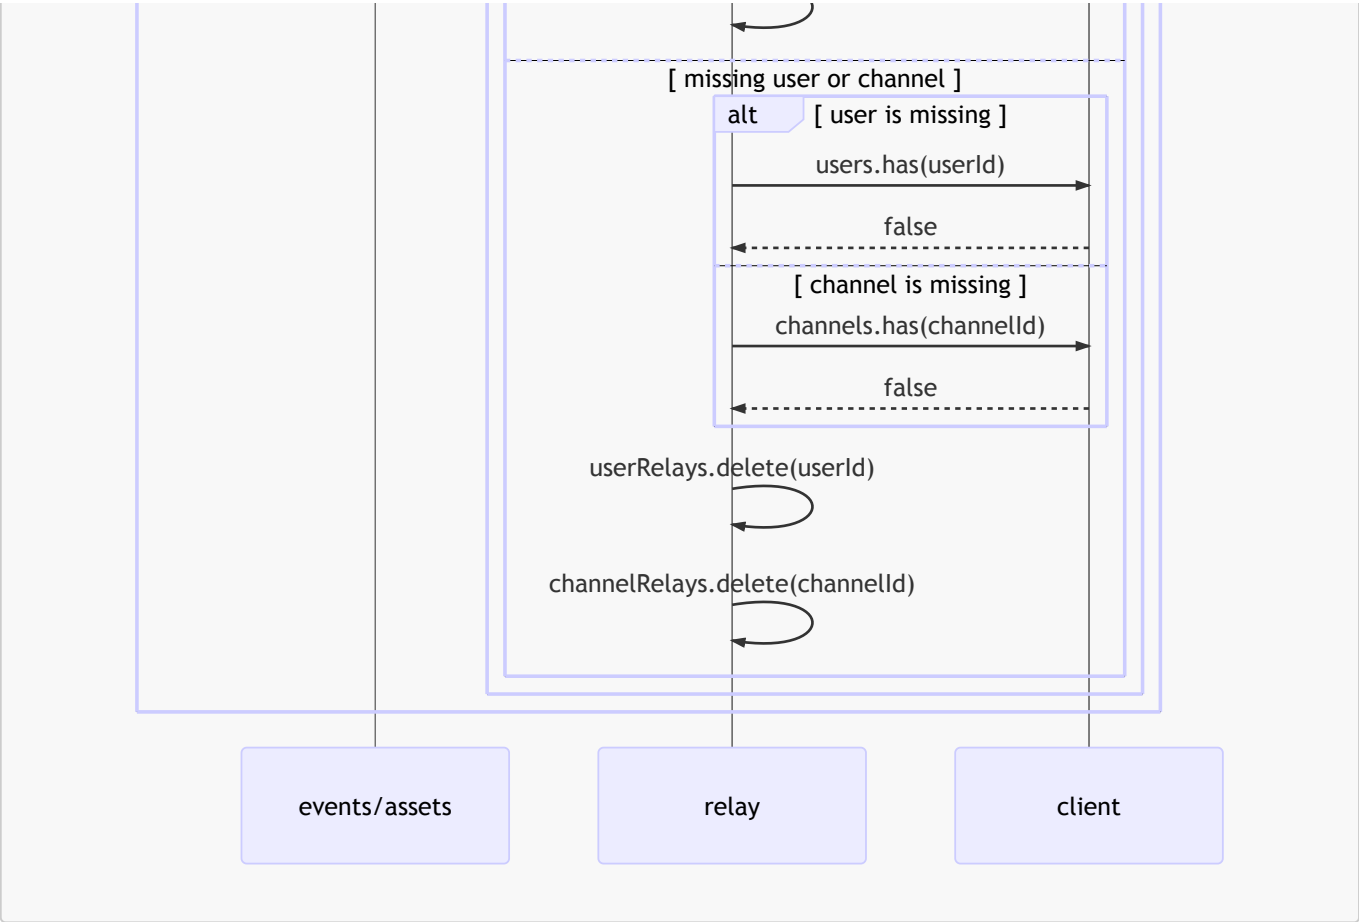

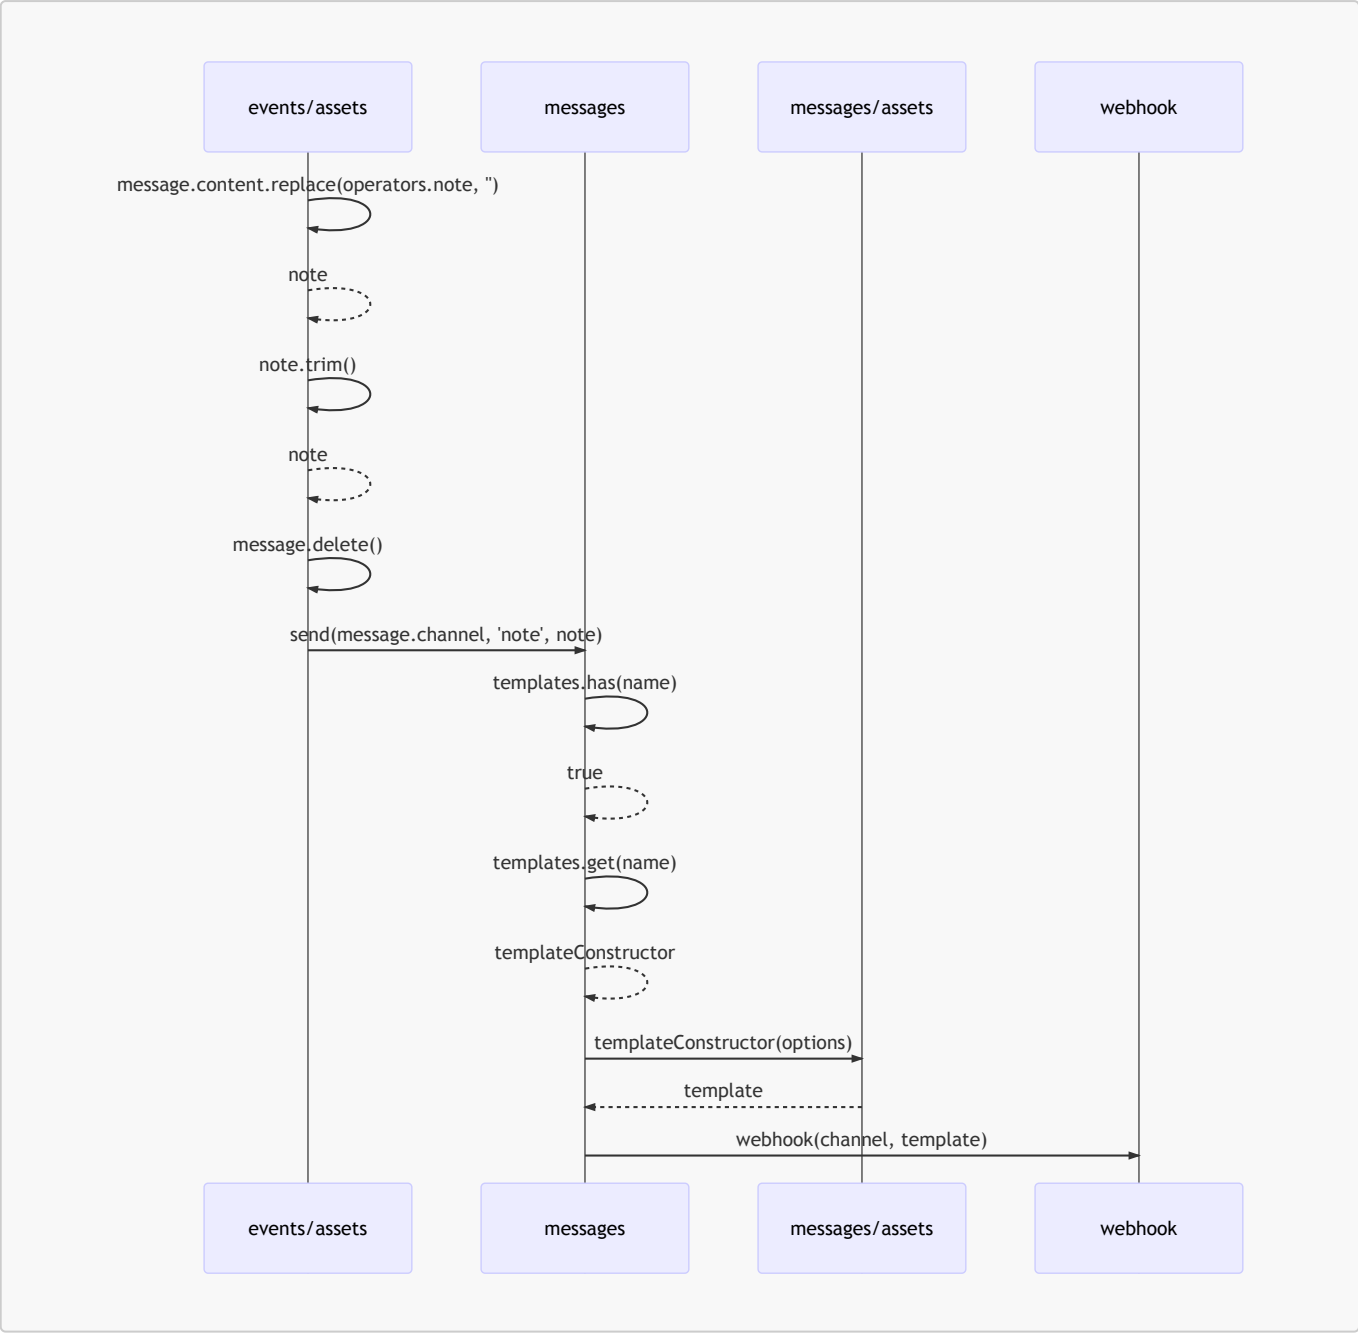

The process of handling a **reliable** message

The process of handling a **note** message

The process of handling a **command** message
